Scenario 2: Important Employee Updates

The customer

Summit Retail Group operates five retail stores with approximately 200 employees. Most employees work on the sales floor and don't regularly check company email. Store managers currently share updates through text messages, printed notices, and team meetings. Important information sometimes gets missed, and managers have no easy way to know who has seen an announcement.

The request

This came in from Michael, the Operations Manager:

> Hi! We're having trouble keeping everyone informed across our stores. Here's what we need:
>
> - I want managers to be able to post announcements and updates for employees.
> - Employees should have an easy way to see updates that apply to them, especially on their phones.
> - For certain important announcements, employees should confirm they've read them.
> - Managers need a simple way to see who has acknowledged an announcement and who hasn't.
> - Eventually, it would be great if employees could ask questions or provide feedback directly on announcements.
>
> We need something that's easy for both managers and employees to use.

What we heard from the team

> "I need to know that every employee has seen important policy and safety updates. Just posting something isn't enough. If someone hasn't read an important announcement, I need a way to identify that." (Rachel, Store Manager)

> "We already get so many messages that it's hard to tell what's actually important. I don't want another app constantly asking me to confirm things. It needs to be simple and not interrupt my work." (Alex, Sales Associate)

Your task

Build a working prototype you'd be comfortable showing Michael next week as a first version. You won't be able to build everything he asked for in 3 hours. Deciding what to build first, and what to leave out, is part of the assignment.

Your demo should cover the four points listed under "What to send us": what you built, a walkthrough of it working, what you had to guess about, and what you left out.
